

Case Study: Chord Energy

Ecopoint has been pleased to partner with Chord Energy in their implementation of the **Geo-STORM** data communication solution. Chord deeply values being an industry leader in responsibility and high-quality assets. ***“Geo-STORM is the optimal data and communication solution for companies desiring the highest level of precision in their data for enhanced decision-making, operations, and asset control.”***

Why Geo-STORM?

Before Chord implemented Geo-STORM, they had large amounts of excellent data regarding all the geospatial aspects of their assets. However, due to data being siloed in different departments across the company, there was an opportunity to avoid redundancies and **increase visibility of asset mapping information to all stakeholders.**

Chord Energy determined that they needed a solution that would give better geospatial data access across the company as well as allow for seamless communication in real-time. **When they chose Geo-STORM, they recognized it as a platform that could tie everything together in the most precise, most efficient way for all facets of the company.**

Implementation:

Chord and Ecopoint had Geo-STORM up and running for use in the field in 2020. After the first year Chord had measured impressive improvements in project timelines and increased safety standards. **The Damage Control department alone had a 75% reduction in line strikes as well as a 65% improvement in time to locate lines year over year.** As a company which already values safety foremost, Chord is gratified to be on the leading edge of safeguarding standards.

Engineers, planners, construction crews, field workers, permitting, reclamation, regulatory staff, damage control, maintenance, and others now have access to real-time data cooperatively. This allows for swift and more accurate decision making in all business aspects. Chord is responsibly bringing value delivery in robust supply.

The Win:

Interdepartmental communication gaps are a thing of the past - **planning, permitting, engineering, construction, operations, and environmental regulatory departments are seamlessly planning together using Geo-STORM.** The company's maintenance department is using the map data, rig drivers are able to access directions; Geo-STORM is providing value at all levels of Chord's organization. Chord is able to better develop existing properties and provide the most optimized and economical energy to their clients. The company gained the ability to begin new programs that wouldn't have been possible without Geo-STORM.

Geo-STORM supports Chord Energy's commitments to stewardship, safety and strategic thinking and keeps all departments in alignment and close communication. For a premier energy operator such as Chord Energy, Geo-STORM proves to be the optimal solution in providing reliable and responsible oil and gas solutions.

If you would like to discuss what Geo-STORM can do for your organization, please reach out to us at the number or email below and schedule a personalized consultation.
